

# The Curry–Howard Isomorphism

Introduction

Some Background

A Three-way Correspondence

Reflections

# Introduction

## ◆ An example

$$\frac{A \rightarrow B \quad A}{B}$$

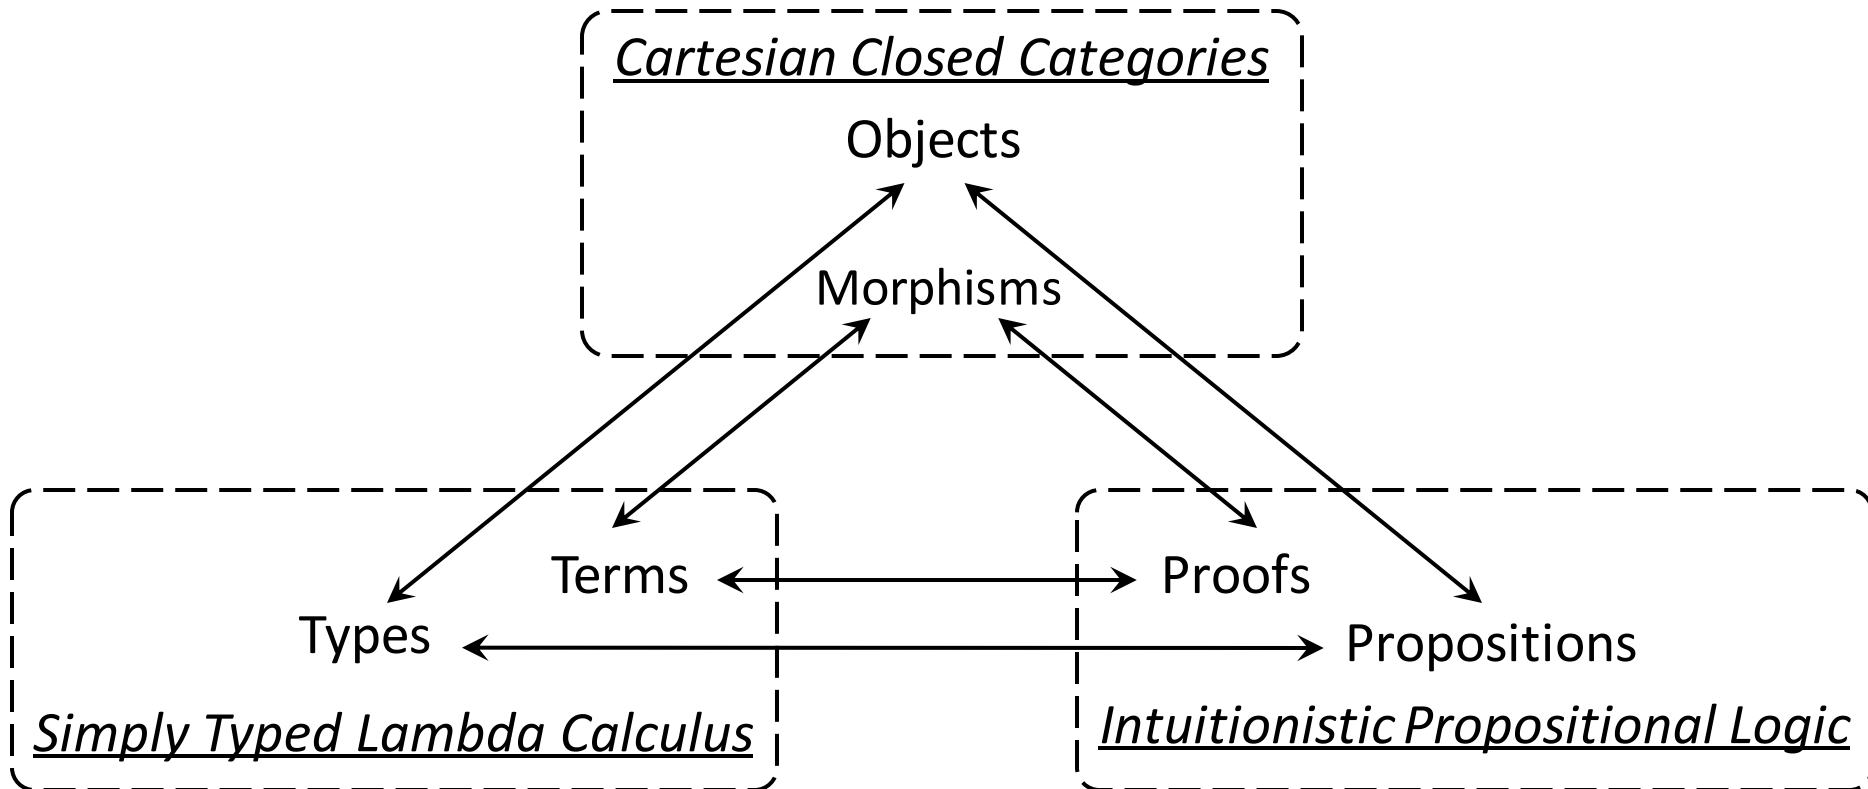

*Modus ponens*

$$\frac{f:A \rightarrow B \quad x:A}{fx:B}$$

*Function application*

## ◆ The Curry-Howard Isomorphism

# A Three-way Correspondence

# Intuitionistic Logic

- ◆ Syntactically, *reductio ad absurdum* (RAA) is not a rule in the natural deduction system of IL.
- ◆ The law of excluded middle  $\varphi \vee \neg\varphi$  and double negation elimination  $\neg\neg\varphi \rightarrow \varphi$  are no longer axioms.

# Simply Typed Lambda Calculus

- ◆ A family of prototype programming languages
- ◆ Simply typed lambda calculus with function types  $\lambda^{\rightarrow}$ 
  - Types  $\sigma ::= \iota \mid \sigma \rightarrow \sigma$
  - Terms  $M ::= x \mid \lambda x.M \mid MM$
- ◆ Three kinds of equivalence
  - $\alpha$ -equivalence  $\lambda x.M =_{\alpha} \lambda y.[y/x]M$
  - $\beta$ -equivalence  $(\lambda x.M)N =_{\beta} [N/x]M$
  - $\eta$ -equivalence  $\lambda x.Mx =_{\eta} M$

# Cartesian Closed Categories

A CCC is a category with the following extra structure:

- ◆ A terminal object *unit* with unique arrow **One**<sup>*A*</sup> for every *A*
- ◆ Object map  $\times$ , function  $\langle \cdot, \cdot \rangle$ , and arrows **Proj**<sub>1</sub> and **Proj**<sub>2</sub> satisfying **Proj**<sub>*i*</sub>  $\circ \langle f_1, f_2 \rangle = f_i$  and  $\langle \mathbf{Proj}_1 \circ g, \mathbf{Proj}_2 \circ g \rangle = g$
- ◆ Object map  $\rightarrow$ , function **Curry**, and arrow **App** satisfying **App**  $\circ \langle \mathbf{Curry}(h) \circ \mathbf{Proj}_1, \mathbf{Proj}_2 \rangle = h$  and  $\mathbf{Curry}(\mathbf{App} \circ \langle k \circ \mathbf{Proj}_1, \mathbf{Proj}_2 \rangle) = k$

# Encoding Proofs in Typed Lambda Terms

- ◆ Every proof leads to a type derivation
- ◆ Every type-derivation brings a well-typed lambda term
- ◆ Therefore, every proof can be encoded in a well-typed lambda term
  - assumptions are encoded in type context
  - proofs of theorems are encoded in closed terms

# Encoding Proofs in Typed Lambda Terms

- ◆ Example – Theorem  $\varphi \rightarrow (\psi \rightarrow \varphi)$

$$\frac{\frac{\frac{\overline{\varphi \vdash \varphi}}{\varphi, \psi \vdash \varphi} (add)}{\varphi \vdash \psi \rightarrow \varphi} (\rightarrow I)}{\vdash \varphi \rightarrow (\psi \rightarrow \varphi)} (\rightarrow I)$$

- ◆ The proof of theorem  $\varphi \rightarrow (\psi \rightarrow \varphi)$  is encoded in combinator  $\mathbf{K} \equiv \lambda x:\varphi. \lambda y:\psi. x : \varphi \rightarrow (\psi \rightarrow \varphi)$

# Decoding Well-typed Lambda Terms

- ◆ Every well-typed lambda term uniquely determines a type derivation
- ◆ Every type derivation leads to a proof (by erasing terms)
- ◆ By decoding a well-typed lambda term, we obtain a proof
  - Rebuild the type derivation of the term
  - Erase all the terms in the derivation

# Decoding Well-typed Lambda Terms

- ◆ Example – Combinator  $\mathbf{K} \equiv \lambda x:\varphi. \lambda y:\psi. x : \varphi \rightarrow (\psi \rightarrow \varphi)$

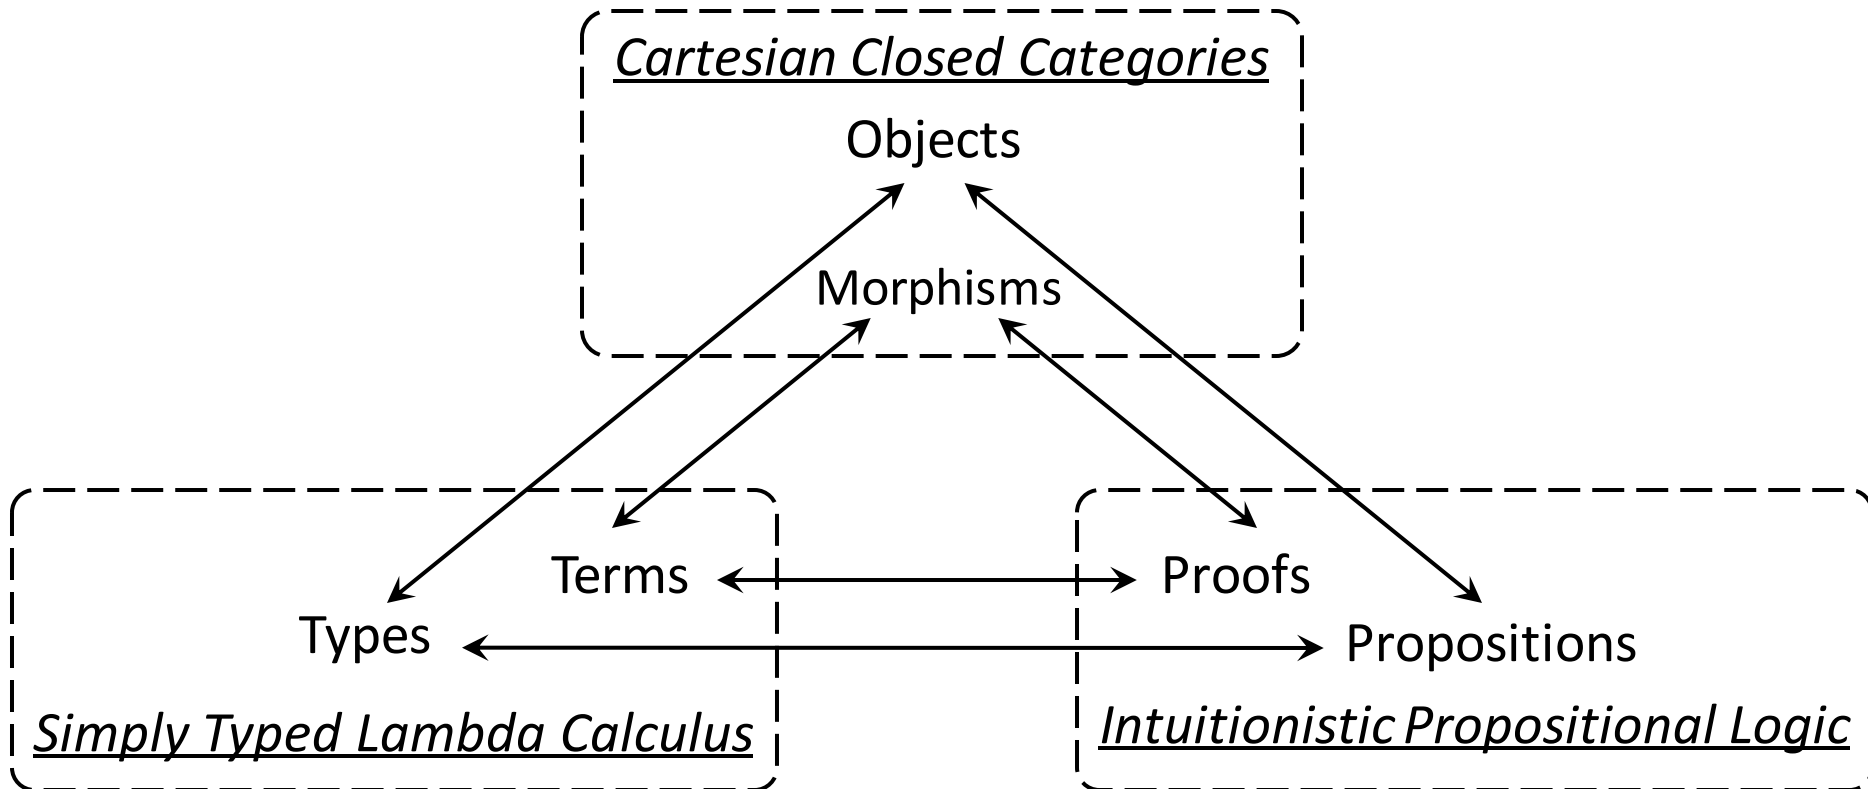

$$\frac{\frac{\frac{\overline{\varphi \vdash \varphi}}{\varphi, \psi \vdash \varphi} (add)}{\varphi \vdash \psi \rightarrow \varphi} (\rightarrow I)}{\vdash \varphi \rightarrow (\psi \rightarrow \varphi)} (\rightarrow I)$$

- ◆ The proof of theorem  $\varphi \rightarrow (\psi \rightarrow \varphi)$  is obtained by decoding the combinator  $\mathbf{K} \equiv \lambda x:\varphi. \lambda y:\psi. x : \varphi \rightarrow (\psi \rightarrow \varphi)$

# Some Correspondence

- ◆ Propositions correspond to types
  - propositional connectives  $\cong$  type constructors
  - set of propositions  $\cong$  set of simple types
- ◆ Proofs correspond to terms
  - natural deduction system  $\cong$  typing rules
  - normalization  $\cong$  reduction
- ◆ Some typical questions
  - proof checking  $\cong$  type checking
  - provability  $\cong$  inhabitation

# A Three-way Correspondence

# $\lambda^{unit, \times, \rightarrow}$ or $\lambda^{\rightarrow}$

- ◆  $\lambda^{unit, \times, \rightarrow}$  CCCs
  - terminal type  $unit$
  - product types  $\sigma \times \tau$
  - function types  $\sigma \rightarrow \tau$
  - terminal object  $unit$
  - products  $A \times B$
  - exponentials  $A \rightarrow B$
- ◆  $\lambda^{\rightarrow}$  is as expressive as  $\lambda^{unit, \times, \rightarrow}$ 
  - product  $\sigma_1 \times \dots \times \sigma_n \cong$  sequence  $\sigma_1, \dots, \sigma_n$
  - function  $f: \sigma \times \tau \rightarrow \rho \cong \bar{f}: \sigma \rightarrow (\tau \rightarrow \rho)$
  - function  $g: \sigma \rightarrow (\tau \times \rho) \cong g_1: \sigma \rightarrow \tau$  and  $g_2: \sigma \rightarrow \rho$

# Interpreting Well-typed Terms as Morphisms

Given a cartesian closed category  $\mathcal{C}$  with some object constants

◆ the interpretation of type expressions

➤  $\mathcal{C}[\iota] = \hat{b}$

➤  $\mathcal{C}[\sigma \rightarrow \tau] = \mathcal{C}[\sigma] \rightarrow \mathcal{C}[\tau]$

◆ the interpretation of type contexts

➤  $\mathcal{C}[\emptyset] = \text{unit}$

➤  $\mathcal{C}[\Gamma, x: \sigma] = \mathcal{C}[\Gamma] \times \mathcal{C}[\sigma]$

# Interpreting Well-typed Terms as Morphisms

- ◆ the interpretation of well-typed terms

Given  $\Gamma \triangleright M: \sigma$ ,  $\mathcal{C}[\Gamma \triangleright M: \sigma]: \mathcal{C}[\Gamma] \rightarrow \mathcal{C}[\sigma]$

- $\mathcal{C}[\Gamma, x: \sigma \triangleright x: \sigma] = \text{Proj}_2^{\mathcal{C}[\Gamma], \mathcal{C}[\sigma]}$
- $\mathcal{C}[\Gamma \triangleright MN: \tau] =$   
$$\text{App}^{\mathcal{C}[\sigma], \mathcal{C}[\tau]} \circ \langle \mathcal{C}[\Gamma \triangleright M: \sigma \rightarrow \tau], \mathcal{C}[\Gamma \triangleright N: \sigma] \rangle$$
- $\mathcal{C}[\Gamma \triangleright \lambda x: \sigma. M: \sigma \rightarrow \tau] = \text{Curry}(\mathcal{C}[\Gamma, x: \sigma \triangleright M: \tau])$
- $\mathcal{C}[\Gamma_1, x: \sigma, \Gamma_2 \triangleright M: \tau] = \mathcal{C}[\Gamma_1, \Gamma_2 \triangleright M: \tau] \circ \chi_f^{\llbracket \Gamma_1, x: \sigma, \Gamma_2 \rrbracket}$

# Soundness

**Theorem (Soundness)** Given any well typed terms  $M$  and  $N$ ,  
if  $\Gamma \triangleright M \equiv_{\alpha\beta\eta} N : \sigma$ , then  $\llbracket \Gamma \triangleright M : \sigma \rrbracket = \llbracket \Gamma \triangleright N : \sigma \rrbracket$  in every CCC.

# Soundness (cont.)

## Proof

- ◆  $\alpha$ -equivalence:  $\lambda x. M =_{\alpha} \lambda y. [y/x]M$   
no term-variable name appears in the calculations
- ◆  $\beta$ -equivalence:  $(\lambda x. M)N =_{\beta} [N/x]M$   
 $\llbracket \Gamma \triangleright (\lambda x: \sigma. M)N : \tau \rrbracket = \llbracket \Gamma \triangleright [N/x]M : \tau \rrbracket$ 
  - $\mathbf{App} \circ \langle \mathbf{Curry}(h) \circ \mathbf{Proj}_1, \mathbf{Proj}_2 \rangle = h$
  - Substitution Lemma
- ◆  $\eta$ -equivalence:  $\lambda x. Mx =_{\eta} M$   
 $\llbracket \Gamma \triangleright \lambda x: \sigma. Mx : \tau \rrbracket = \llbracket \Gamma \triangleright M : \sigma \rightarrow \tau \rrbracket$ 
  - $\mathbf{Curry}(\mathbf{App} \circ \langle k \circ \mathbf{Proj}_1, \mathbf{Proj}_2 \rangle) = k$

# Completeness

**Theorem (Completeness)** Given any  $\Gamma \triangleright M : \sigma$  and  $\Gamma \triangleright N : \sigma$ , there exists a CCC  $\mathcal{C}$  such that if  $\mathcal{C}[\![\Gamma \triangleright M : \sigma]\!] = \mathcal{C}[\![\Gamma \triangleright N : \sigma]\!]$ , then  $\Gamma \triangleright M \equiv_{\alpha\beta\eta} N : \sigma$ .

# Completeness (cont.)

## Proof

◆ Construct one category  $\mathcal{C}$  from  $\lambda^{\rightarrow}$

➤ Objects – sequences of types

- $[]$  – terminal object
- $[\sigma_1, \dots, \sigma_m]$  – products of  $[\sigma_i]$  –  $\vec{\sigma}_m$

➤ Morphisms – tuples of equivalence classes of terms

$$\langle \{ \vec{x}_m : \vec{\sigma}_m \triangleright N_i : \tau_i \mid \Gamma \triangleright N_i = M_i : \tau_i \} \mid i = 1, \dots, n \rangle : \vec{\sigma}_m \rightarrow \vec{\tau}_n$$

◆  $\mathcal{C}$  is cartesian closed (the most difficult part)

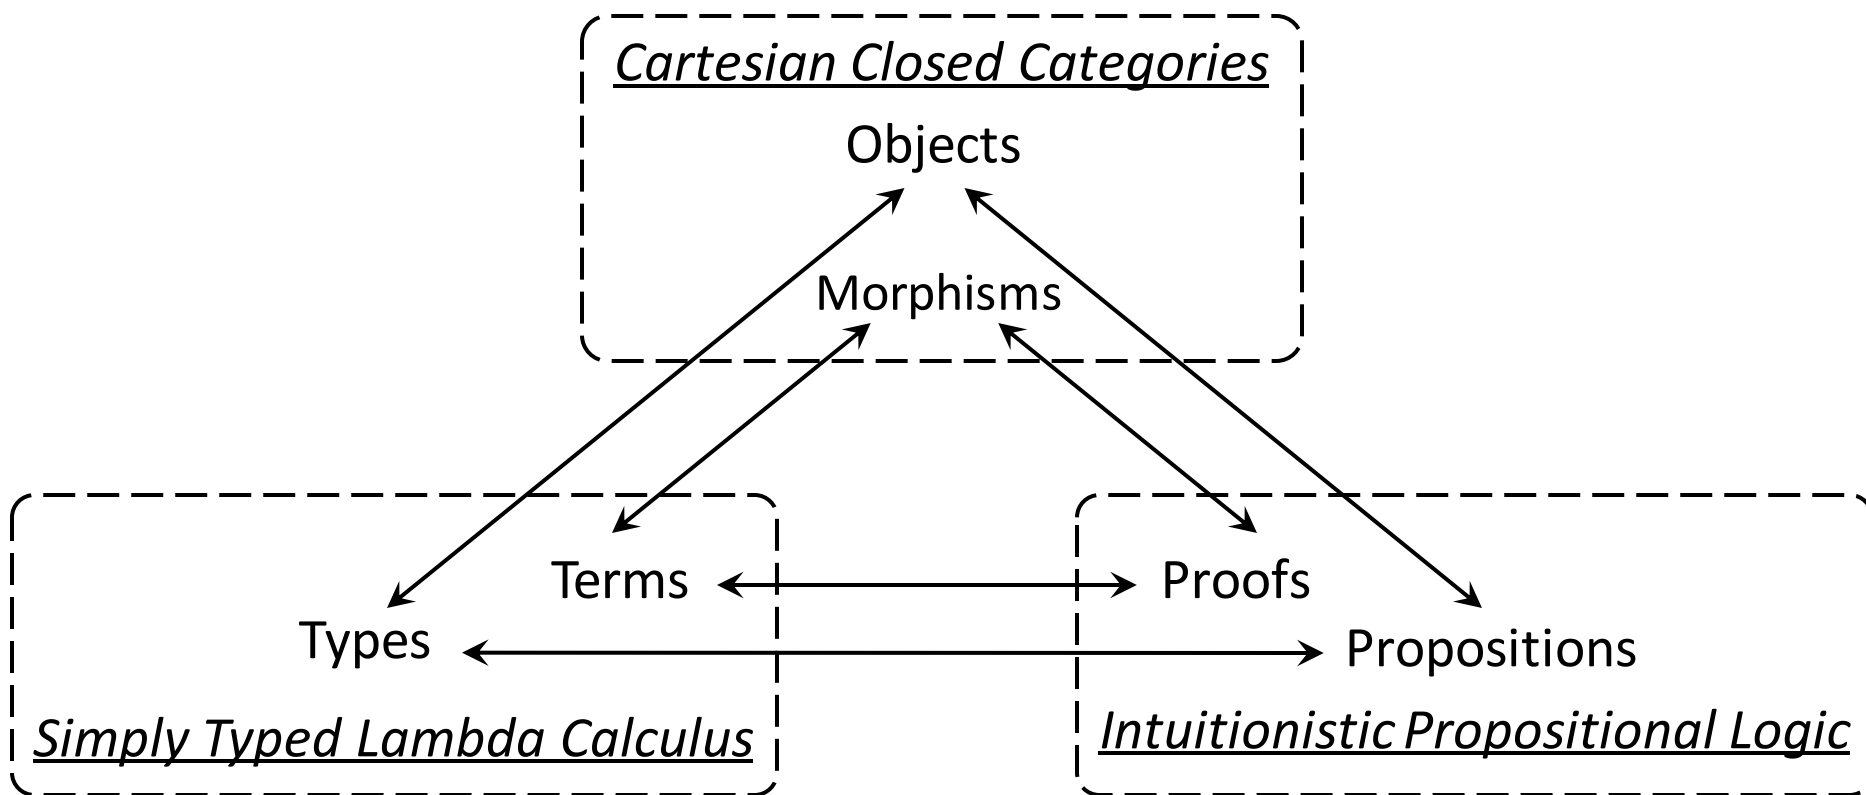

◆  $\mathcal{C}[\Gamma \triangleright M : \sigma] = \langle \{ \Gamma \triangleright N : \sigma \mid \Gamma \triangleright N = M : \sigma \} \rangle$

If  $\mathcal{C}$  satisfies  $[\Gamma \triangleright M : \sigma] = [\Gamma \triangleright N : \sigma]$ ,

then  $\Gamma \triangleright M \equiv_{\alpha\beta\eta} N : \sigma$ .

# Reflections

- ◆ A connection between very diverse mathematical subjects

# Reflections

- ◆ The C.H. isomorphism can be extended to stronger logics, more expressive languages and richer categories
  - First order logic  $\cong$  Dependent types
  - PCF  $\cong$  Category of domains
  - ...

# Reflections

- ◆ The C.H. isomorphism helps to prove theorems in each field
  - Q: Is the inhabitation problem in Dependent Types decidable?
  - A: No, it is undecidable.
  - Inhabitation  $\cong$  Provability
  - Dependent Types  $\cong$  First Order Logic
  - Provability in First Order Logic is undecidable

# The Curry-Howard Isomorphism

Thank you for your listening!

# Appendix

## ◆ Connectives VS. Type Constructors

Formulas in intuitionist propositional logic	Types in full simply-typed lambda calculus
False formula $\perp$	Initial type <i>null</i>
True formula $\top$ ( $\neg\perp$ )	Terminal type <i>unit</i>
Implication $\varphi_0 \rightarrow \varphi_1$	Function type $\sigma_0 \rightarrow \sigma_1$
Conjunction $\varphi_0 \wedge \varphi_1$	Product type $\sigma_0 \times \sigma_1$
Disjunction $\varphi_0 \vee \varphi_1$	Sum type $\sigma_0 + \sigma_1$

# Appendix

## ◆ Natural Deduction System VS. Typing Rules

Natural deduction in intuitionist propositional logic	Typing rules in full simply-typed lambda calculus
$\frac{}{\Gamma_1, \varphi, \Gamma_2 \vdash \varphi} \text{Axiom}$	$\frac{}{\Gamma_1, x: \sigma, \Gamma_2 \vdash x: \sigma} \text{Var}$
$\frac{\Gamma, \varphi \vdash \psi}{\Gamma \vdash \varphi \rightarrow \psi} \rightarrow I$	$\frac{\Gamma, x: \sigma \vdash M: \tau}{\Gamma \vdash \lambda x. M: \sigma \rightarrow \tau} \rightarrow I$
$\frac{\Gamma \vdash \varphi \rightarrow \psi, \Gamma \vdash \varphi}{\Gamma \vdash \psi} \rightarrow E$	$\frac{\Gamma \vdash M: \sigma \rightarrow \tau, \Gamma \vdash N: \sigma}{\Gamma \vdash MN: \tau} \rightarrow E$
$\frac{\Gamma \vdash \varphi, \Gamma \vdash \psi}{\Gamma \vdash \varphi \wedge \psi} \wedge I$	$\frac{\Gamma \vdash M: \sigma, \Gamma \vdash N: \tau}{\Gamma \vdash \langle M, N \rangle: \sigma \times \tau} \times I$

# Appendix

## ◆ Natural Deduction System VS. Typing Rules (cont.)

$\frac{\Gamma \vdash \varphi \wedge \psi}{\Gamma \vdash \varphi} \wedge E_1$	$\frac{\Gamma \vdash M:\sigma \times \tau}{\Gamma \vdash \text{Proj}_1^{\sigma,\tau} M:\sigma} \times E_1$
$\frac{\Gamma \vdash \varphi \wedge \psi}{\Gamma \vdash \psi} \wedge E_2$	$\frac{\Gamma \vdash M:\sigma \times \tau}{\Gamma \vdash \text{Proj}_2^{\sigma,\tau} M:\tau} \times E_2$
$\frac{\Gamma \vdash \varphi}{\Gamma \vdash \varphi \vee \psi} \vee I_1$	$\frac{\Gamma \vdash M:\sigma}{\Gamma \vdash \text{Inleft}^{\sigma,\tau} M:\sigma + \tau} + I_1$
$\frac{\Gamma \vdash \psi}{\Gamma \vdash \varphi \vee \psi} \vee I_2$	$\frac{\Gamma \vdash M:\tau}{\Gamma \vdash \text{Inright}^{\sigma,\tau} M:\sigma + \tau} + I_1$
$\frac{\Gamma \vdash \varphi \vee \psi, \Gamma \vdash \varphi \rightarrow \chi, \Gamma \vdash \psi \rightarrow \chi}{\Gamma \vdash \chi} \vee E$	$\frac{\Gamma \vdash M:\sigma + \tau, \Gamma \vdash N:\sigma \rightarrow \rho, \Gamma \vdash P:\tau \rightarrow \rho}{\Gamma \vdash \text{Case}^{\sigma,\tau,\rho} MNP:\rho} + E$
